

Munich University of Applied Sciences

--12.12.19 -- Never forget anything again with the new Alexa skill "Process Flows", designed by students at the Munich University of Applied Sciences

How "Process Flows" will make everyday life easier for people with Alzheimer's disease:

Today a team from Munich University of Applied Sciences released its new Alexa voice assistant skill "Process Flows".

In a conversation with an Alzheimer's patient, the students realized that the demands of the modern world were increasing while the ability of the patient to cope with them was decreasing. As an answer to this problem, they designed the Alexa skill "Process Flows". It requires very little effort and can be used intuitively. Overall, it is designed to adapt to all the individual needs of the patient. This way, the team hopes to support him/her in his/her everyday life.

""Process Flows" was developed with ease of use in mind and so far, the feedback from patients has been great." - Development Team
